

CSE 473/573-A L11: ALIGNMENT & FITTING

Chen Wang
Spatial AI & Robotics Lab
Department of Computer Science and Engineering

University at Buffalo The State University of New York

What are Alignment and Fitting?

- Alignment
 - •Find the parameters of a transformation that best aligns matched points
- Fitting
 - •Find the parameters of a model that best fit the data

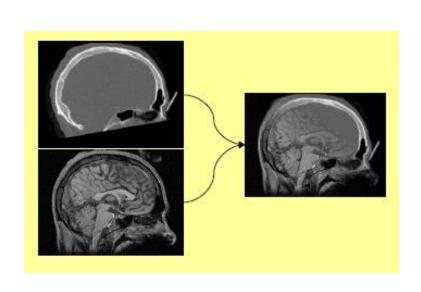

Fitting and Alignment: Methods

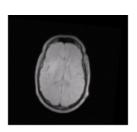

- Hypothesize and test
 - Generalized Hough transform
- General Alignment
 - Homographies
 - Rotational Panoramas
 - Global Alignment
 - RANSAC
 - Warping
 - Blending
- Global optimization / Search for parameters
 - Least squares fit
 - Robust least squares
 - Other parameter search methods

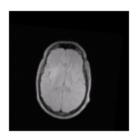

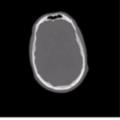

Motivation: Medical image registration

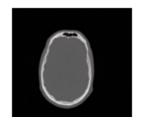

Motivation: Mosaics

- Getting the whole picture
 - Typical camera: 50° x 35°

Motivation: Mosaics

- Getting the whole picture
 - Typical camera: 50° x 35°
 - Human Vision: 176° x 135°

Motivation: Mosaics

- Getting the whole picture
 - Typical camera: 50° x 35°
 - Human Vision: 176° x 135°

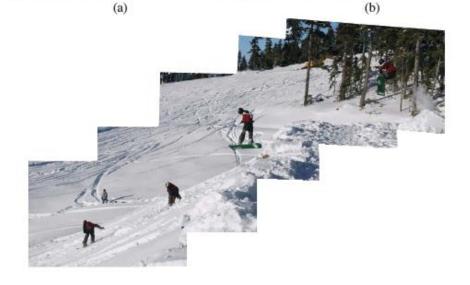

Alignment

- Homography
- Rotational Panoramas
- RANSAC (Next Lecture)
- Global alignment
- Warping
- Blending

Motion models

- What happens when we take two images with a camera and try to align them?
- translation?
- rotation?
- •scale?
- affine?
- perspective?

Image Warping (Recap)

image filtering: change range of image

•
$$g(x) = h(f(x))$$

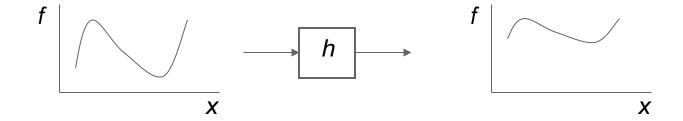

image warping: change domain of image

•
$$g(x) = f(h(x))$$

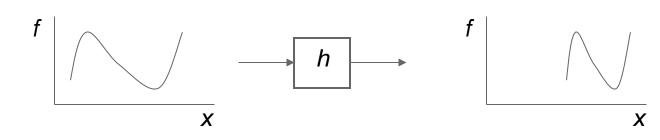

Image Warping

image filtering: change range of image

•
$$g(x) = h(f(x))$$

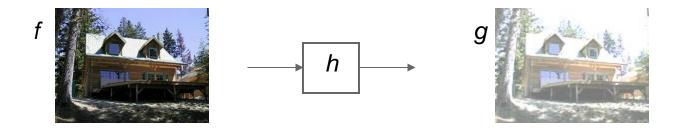

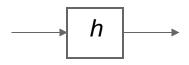

image warping: change domain of image

•
$$g(x) = f(h(x))$$

Parametric (global) warping

Examples of parametric warps:

translation

rotation

aspect

affine

perspective

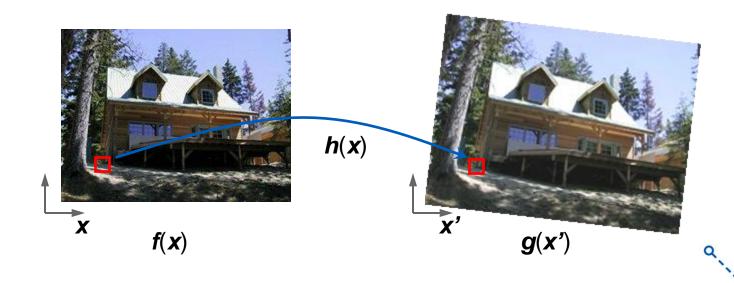

cylindrical

Image Warping

• Given a coordinate transform x' = h(x) and a source image f(x), how do we compute a transformed image g(x') = f(h(x))?

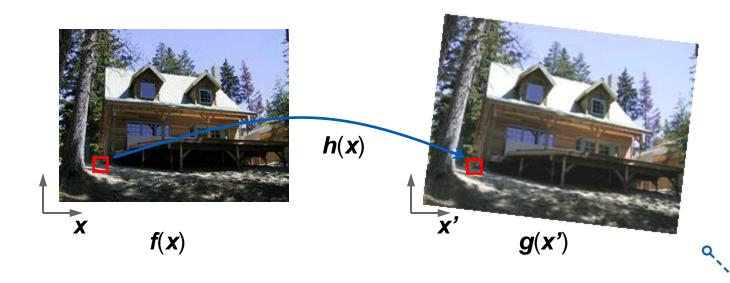

Forward Warping

• Send each pixel f(x) to its corresponding location x' = h(x) in g(x')

What if pixel lands "between" two pixels?

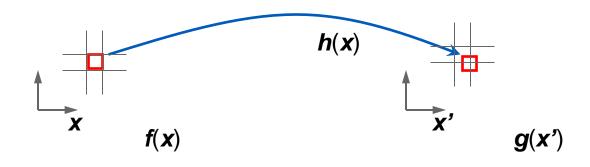

Forward Warping

• Send each pixel f(x) to its corresponding location x' = h(x) in g(x')

- What if pixel lands "between" two pixels?
- Answer: add "contribution" to several pixels, normalize later

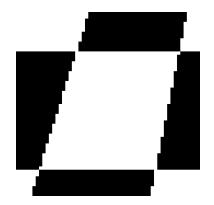

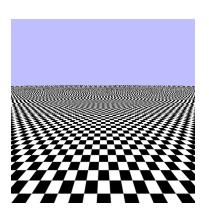

Interpolation

- Possible interpolation filters:
 - Nearest Neighbor
 - Bilinear
 - Bicubic
- Needed to prevent "jaggies" and "texture crawl"

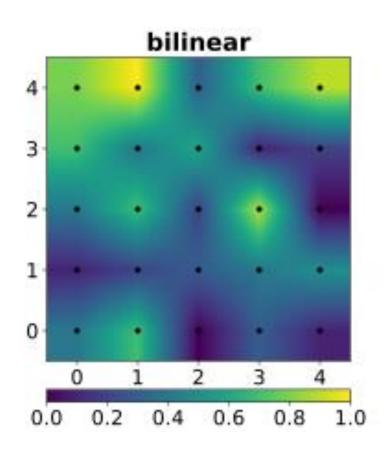

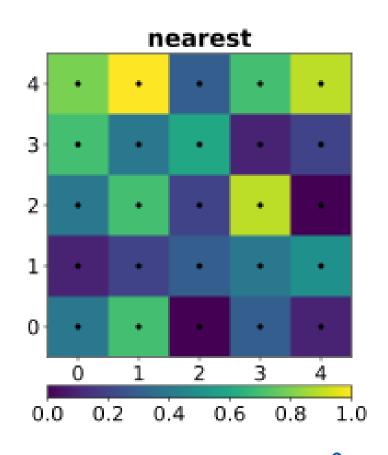

Bilinear interpolation

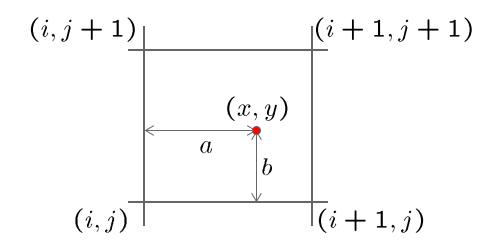

Bilinear interpolation

Sampling at f(x,y):

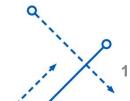

$$f(x,y) = (1-a)(1-b) \quad f[i,j]$$

$$+a(1-b) \quad f[i+1,j]$$

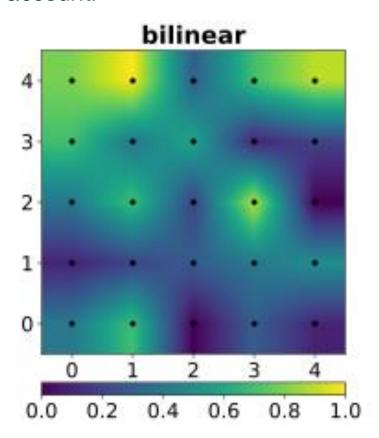

$$+ab \quad f[i+1,j+1]$$

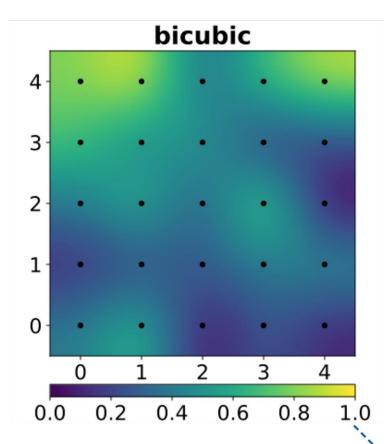

$$+(1-a)b \quad f[i,j+1]$$

- Bilinear interpolation processes 2x2 (4 pixels) squares
- Bicubic interpolation processes 4x4 (16 pixels) squares to take image gradients into account.

If the quality is of concern, bicubic would be the best choice.

$$p(x,y) = \sum_{i=0}^{3} \sum_{j=0}^{3} a_{ij} x^{i} y^{j}.$$

surface p(x,y) on the unit square [0,1] imes [0,1] that is continuous

This requires determining the 16 coefficients.

Consider 4 corners of the unit square. (0, 0) (1, 0) (0, 1) (1, 1)

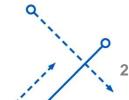

1.
$$f(0,0) = p(0,0) = a_{00}$$
,

2.
$$f(1,0) = p(1,0) = a_{00} + a_{10} + a_{20} + a_{30}$$
,

3.
$$f(0,1) = p(0,1) = a_{00} + a_{01} + a_{02} + a_{03}$$

4.
$$f(1,1)=p(1,1)=\sum\limits_{i=0}^{3}\sum\limits_{j=0}^{3}a_{ij}.$$

Likewise, eight equations for the derivatives in the x and the y directions:

We need following derivatives

$$p_x(x,y) = \sum\limits_{i=1}^{3}\sum\limits_{j=0}^{3}a_{ij}ix^{i-1}y^j,$$

$$p_y(x,y) = \sum\limits_{i=0}^{3} \sum\limits_{j=1}^{3} a_{ij} x^i j y^{j-1},$$

$$p_{xy}(x,y) = \sum\limits_{i=1}^{3}\sum\limits_{j=1}^{3}a_{ij}ix^{i-1}jy^{j-1}.$$

1.
$$f_x(0,0)=p_x(0,0)=a_{10},$$

2.
$$f_x(1,0) = p_x(1,0) = a_{10} + 2a_{20} + 3a_{30}$$
,

3.
$$f_x(0,1) = p_x(0,1) = a_{10} + a_{11} + a_{12} + a_{13},$$

4.
$$f_x(1,1) = p_x(1,1) = \sum\limits_{i=1}^3 \sum\limits_{i=0}^3 a_{ij}i,$$

5.
$$f_y(0,0) = p_y(0,0) = a_{01}$$
,

6.
$$f_y(1,0) = p_y(1,0) = a_{01} + a_{11} + a_{21} + a_{31}$$
,

7.
$$f_y(0,1) = p_y(0,1) = a_{01} + 2a_{02} + 3a_{03},$$

8.
$$f_y(1,1) = p_y(1,1) = \sum\limits_{i=0}^3 \sum\limits_{j=1}^3 a_{ij} j$$
.

And four equations for the xy mixed partial derivative:

1.
$$f_{xy}(0,0)=p_{xy}(0,0)=a_{11},$$

2.
$$f_{xy}(1,0)=p_{xy}(1,0)=a_{11}+2a_{21}+3a_{31},$$

3.
$$f_{xy}(0,1) = p_{xy}(0,1) = a_{11} + 2a_{12} + 3a_{13}$$
,

4.
$$f_{xy}(1,1) = p_{xy}(1,1) = \sum_{i=1}^{3} \sum_{j=1}^{3} a_{ij}ij$$
.

Grouping the unknown parameters a_{ij} in a vector

and letting

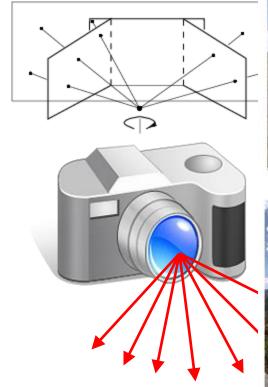

$$\boldsymbol{x} = \left[\ f(0,0) \ \ f(1,0) \ \ f(0,1) \ \ f(1,1) \ \ f_x(0,0) \ \ f_x(1,0) \ \ f_x(0,1) \ \ f_x(1,1) \ \ f_y(0,0) \ \ f_y(1,0) \ \ f_y(0,1) \ \ f_y(1,1) \ \ f_{xy}(0,0) \ \ f_{xy}(1,0) \ \ f_{xy}(0,1) \ \ f_{xy}(1,1) \ \right]^T,$$

the above system of equations can be reformulated into a matrix for the linear equation $A\alpha=x$.

Inverting the matrix gives the more useful linear equation $A^{-1}x=lpha$, where

Panoramas

Obtain a wide angle view by combining multiple images.

image from S. Seitz

How to stitch together a panorama?

Basic Procedure

- Take a sequence of images from the same position
 - Rotate the camera about its optical center.
- Compute transformation between 2nd and 1st image
- Transform the 2nd image to overlap with the 1st
- Blend the two together to create a mosaic
- (If there are more images, repeat)
- Why should this work at all?
 - What about the 3D geometry of the scene?
 - Why aren't we using it?

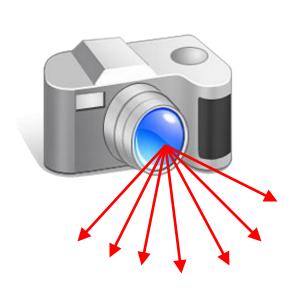

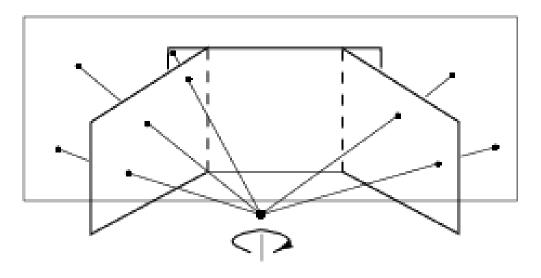

image from S. Seitz

Correspondence

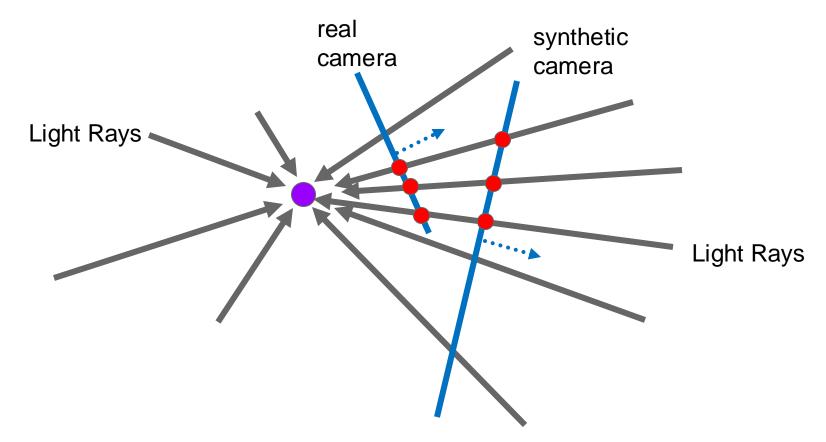

Allows us to map image back to some real space

Panoramas: generating synthetic views

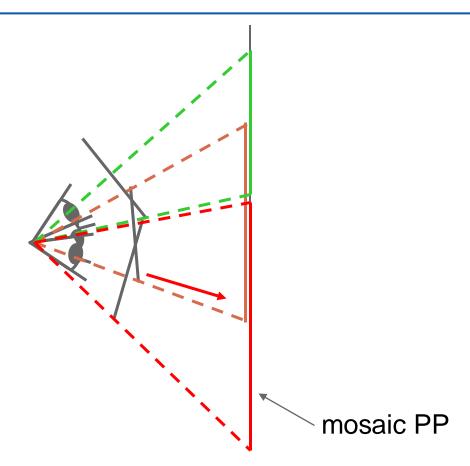

Can generate any synthetic camera view as long as it has the same center of projection!

Source: Alyosha Efros

Image reprojection

- The mosaic has a natural interpretation in 3D
 - The images are reprojected onto a common plane

Source: Steve S

- The mosaic is formed on this plane
- Mosaic is a synthetic wide-angle camera

Recap: 2D coordinate transformations

$$X' = X + t$$

$$\mathbf{x} = (x, y)$$

$$x' = R x + t$$

$$x' = sRx + t$$

$$X' = A X + t$$

$$\underline{x}' \cong H \underline{x} \qquad \underline{x} = (x, y, 1)$$

(x is a homogeneous coordinate)

These all form a nested group (closed w/ inv.)

Basic 2D Transformations

Basic 2D transformations as 3x3 matrices

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & t_x \\ 0 & 1 & t_y \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Translate

$$\begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} = \begin{bmatrix} \cos \Theta & -\sin \Theta & 0 \\ \sin \Theta & \cos \Theta & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & sh_x & 0 \\ sh_y & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$

Rotate

$$\begin{bmatrix} \mathbf{x}' \\ \mathbf{y}' \\ 1 \end{bmatrix} = \begin{bmatrix} \mathbf{s}_{x} & 0 & 0 \\ 0 & \mathbf{s}_{y} & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ 1 \end{bmatrix}$$

Scale

$$\begin{bmatrix} \mathbf{x}' \\ \mathbf{y}' \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & s\mathbf{h}_x & 0 \\ s\mathbf{h}_y & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} \mathbf{x} \\ \mathbf{y} \\ 1 \end{bmatrix}$$

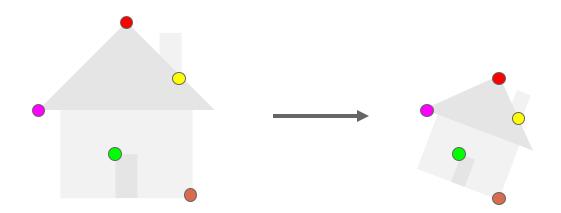

Shear (Skew)

Image alignment

- Two broad approaches:
 - Direct (pixel-based) alignment
 - Search for alignment where most pixels agree
 - Feature-based alignment
 - Search for alignment where extracted features agree
 - Can be verified using pixel-based alignment

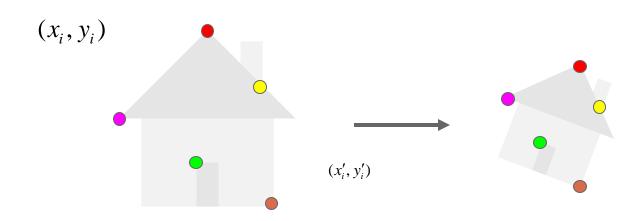

Affine model approximates perspective projection of planar objects.

 Assuming we know the correspondences, how do we get the transformation?

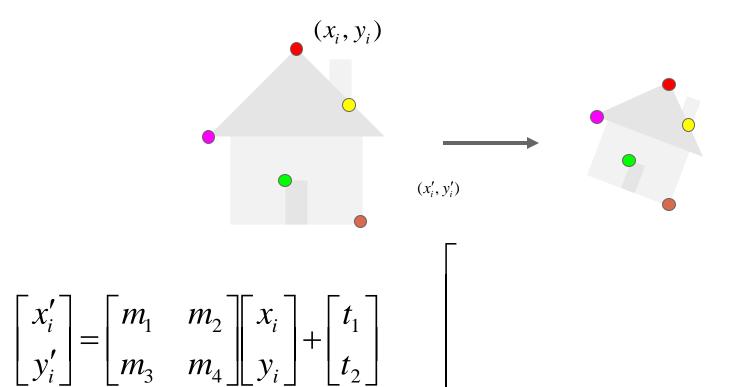

$$\begin{bmatrix} x_i' \\ y_i' \end{bmatrix} = \begin{bmatrix} m_1 & m_2 \\ m_3 & m_4 \end{bmatrix} \begin{bmatrix} x_i \\ y_i \end{bmatrix} + \begin{bmatrix} t_1 \\ t_2 \end{bmatrix}$$

 Assuming we know the correspondences, how do we get the transformation?

$$\begin{bmatrix} x_{i} & y_{i} & 0 & 0 & 1 & 0 \\ 0 & 0 & x_{i} & y_{i} & 0 & 1 \end{bmatrix} \begin{bmatrix} m_{1} \\ m_{2} \\ m_{3} \\ m_{4} \\ t_{1} \\ t_{2} \end{bmatrix} = \begin{bmatrix} \cdots \\ x'_{i} \\ y'_{i} \\ \cdots \end{bmatrix}$$

- How many matches (correspondence pairs) do we need to solve for the transformation parameters?
- Once we have solved for the parameters, how do we compute the coordinates of the corresponding point for (x_{new}, y_{new}) ?

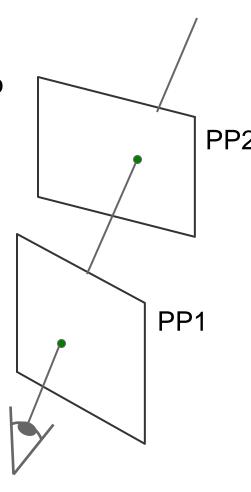

Homography

- Take as a 2D image warp using projective transform.
- A projective transform is a mapping between any two
 PPs with the same center of projection
 - rectangle should map to arbitrary quadrilateral
 - parallel lines aren't preserved.
 - but straight lines are preserved.
- Called Homography

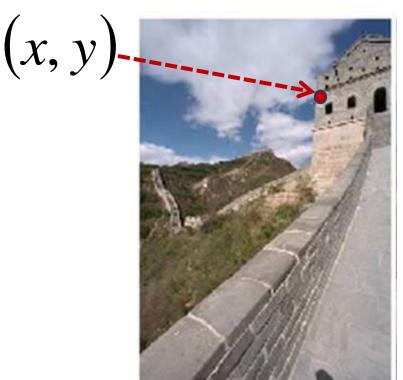

$$\begin{bmatrix} wx' \\ wy' \\ w \end{bmatrix} = \begin{bmatrix} * & * & * \\ * & * & * \\ * & * & * \end{bmatrix} \begin{bmatrix} x \\ y \\ 1 \end{bmatrix}$$
p' H p

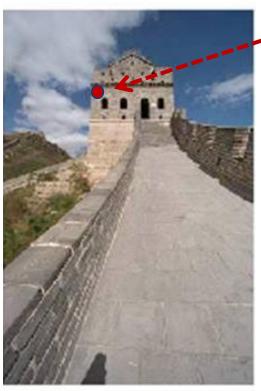

Source: Alyosha Efros

Solving for homographies

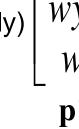

$$= (x', y')$$

To apply a given homography H

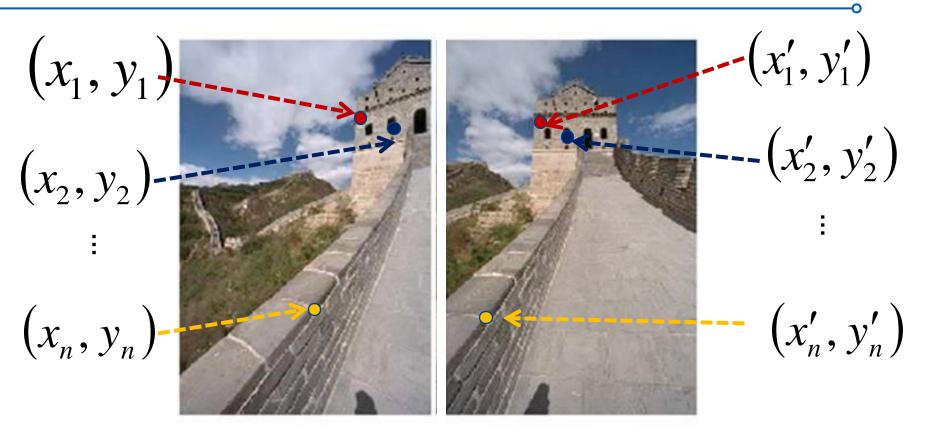

- Compute **p**' = **Hp** (regular matrix multiply)
- Convert p' from homogeneous to image

 $= \begin{bmatrix} * & * & * \\ * & * & * \\ * & * & * \end{bmatrix} \begin{bmatrix} x \\ y \\ l_o \end{bmatrix}$

Solving for homographies

To **compute** the homography given pairs of corresponding points, we need to set up an equation where the parameters of **H** are the unknowns...

Solving for homographies

$$\mathbf{p'} = \mathbf{Hp} \qquad \begin{vmatrix} wx' \\ wy' \\ w \end{vmatrix} = \begin{vmatrix} a & b & c \\ d & e & f \\ g & h & i \end{vmatrix} \begin{vmatrix} x \\ y \\ 1 \end{vmatrix}$$

- •Can set scale factor i = 1 or ||H|| = 1. So, there are 8 unknowns.
- •Set up a system of linear equations:

$$\cdot$$
Ah = b

where vector of unknowns $h = [a, b, c, d, e, f, g, h]^T$

- Need at least 8 equations (4 points), but the more the better...
- •Solve for H. If over-constrained, solve using least-squares:

$$\min \|Ah-b\|^2$$

$$h = (A^T A)^{-1} A^T b$$

Proof of least squares

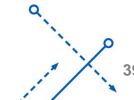

$$F(h) = ||Ah - b||^2 = (Ah - b)^T (Ah - b)^T$$

$$F(h) = h^T A^T A h - h^T A^T b - b^T A h + b^T b$$

$$\bullet \frac{\partial}{\partial h} F(h) = 2A^T A h - A^T b - (b^T A)^T$$

- Setting derivative to 0: $\frac{\partial}{\partial h} F(h) = 0$
- $\bullet A^T A h = A^T b$
- $\bullet h = (A^T A)^{-1} A^T b$

How to stitch together a panorama?

- Take a sequence of images from the same position
 - Rotate the camera about its optical center
- Compute transformation between second image and first
- Transform the second image to overlap with the first
- Blend the two together to create a mosaic
- If there are more images, repeat
